Studies on the role of Na<sup>+</sup>, K<sup>+</sup>-ATPase inhibition in digitalis activity suggests that there is a dissociation between the positive inotropic effects of digitalis and Na<sup>+</sup>, K<sup>+</sup>-ATPase inhibition, as well as between the inotropic and electrophysiologic effects of digitalis. It may be that there is a receptor for positive inotropy not related to inhibition of cardiac transport ATPase, and another binding site related to the effect of digitalis on rhythm.
